2015 CORN PERFORMANCE TRIALS IN TEXAS

Ronnie Schnell, Dennis Pietsch, Katrina Horn, Jonathan Moreno, and Seth Murray

Introduction

Texas A&M AgriLife Research conducts the corn performance tests each year to provide growers in Texas with accurate and unbiased information on hybrid performance at locations across the state. Selection of superior hybrids that are well adapted for a given region is essential for maximizing yield and profit.

This year, six irrigated and five non-irrigated test sites were planted in the major production regions of Texas. Major corn production regions include the Western Gulf Coastal Plain, Southern Texas Plains, East Central Texas Plains, Texas Blackland Prairies and High Plains. Approximate locations of the 2015 test sites are shown in Figure 1. A total of 329 entries were evaluated across 11 locations representing 69 unique hybrids from 13 commercial seed companies. Commercial seed companies enter hybrids into each trial location at their own discretion.

Performance trials are conducted by personnel from the Crop Testing Program, Texas A&M AgriLife Research, and financed by fees collected from participating commercial seed companies. Test sites are on privately owned farms or at Texas A&M University AgriLife Research Centers. All entries are randomized and replicated four times at each location. All test sites are managed according to practices common to each production region. Field maps and planting plans can be found at the link below shortly after planting. Following harvest, results are statistically analyzed and made available at: <http://varietytesting.tamu.edu/corn/>.

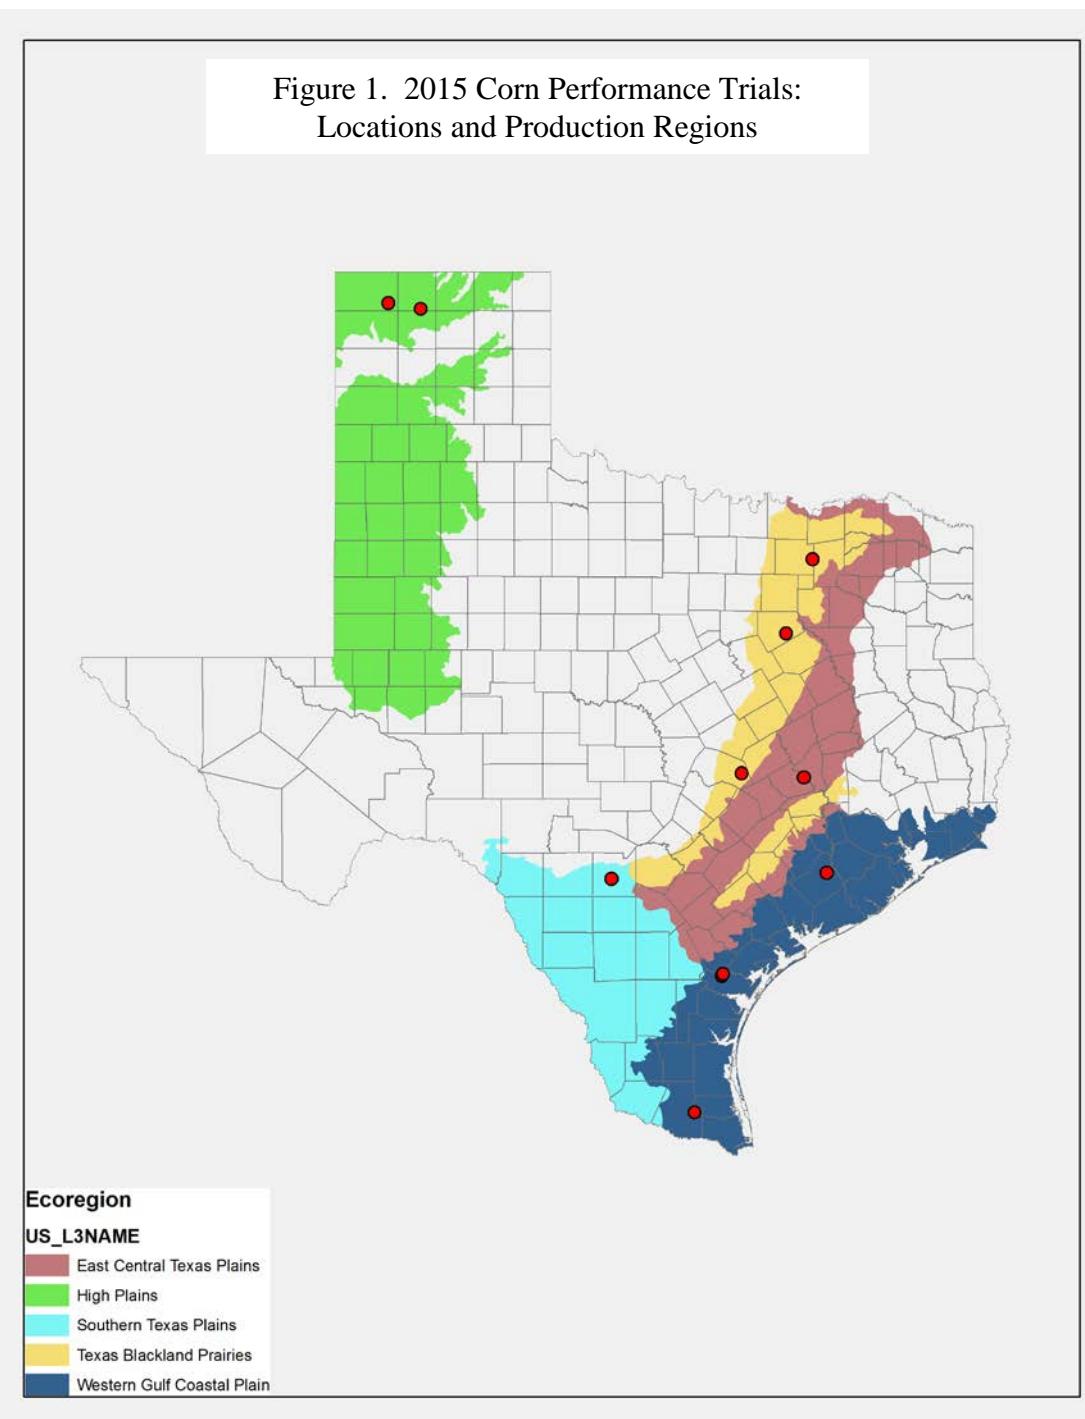

Suggestions for Selecting Hybrids and Varieties

Variety or hybrid selection is often the first decision a grower must make each crop year. The goal is to identify hybrids with superior performance (top yielding) for your environment. Many environments exist in Texas with significant variation within regions and across years, mostly due to variation in weather. Documented, consistent yield performance within a region is essential for selecting hybrids that will perform well on your farming operation. This means that evaluation of hybrids over multiple locations and years (when possible) is the best way to predict future performance. Exercise caution when using single location data to compare hybrid performance.

Following yield performance, other characteristics may be useful for selecting the best hybrid. Maturity or days to flowering may be important for selecting hybrids that are appropriate for your

growing season/conditions. Hybrids that possess insect or herbicide traits may be useful for managing various insect and weed pests found on your farm. While consistent yield will be the most important factor affecting hybrid selection, additional plant characteristics or traits could be used to select from hybrids with similar yield performance.

Figure 1. 2015 Corn Performance Trials:
Locations and Production Regions

Field-Plot Techniques

Performance trials are conducted at each location using a randomized complete block design with four replications of each entry (hybrid). Seeds for each hybrid are packaged to obtain a final plant population appropriate for each production region and cropping system. Plots are generally 2 rows wide with row spacing ranging from 30 to 40 inches depending on location. Seeds are packaged to deliver 30 feet of planted row per plot. Seed is planted using a belt cone planter with John Deere MaxEmerge XP planter units at all sites. Following emergence, two feet of row are trimmed on each side resulting in 26 ft plots and 4 ft alleys. Alleys are maintained free of weeds throughout the growing season through mechanical or chemical control measures.

Cultural and agronomic practices adapted for each region are used as determined by the cooperators. Field data such as plant stands, plant height, ear height, silk dates and lodging are recorded at the appropriate times. All locations are harvested with a John Deere 3300 plot combine equipped with the HarvestMaster Grain Gauge that measures plot weight, test weight, and grain moisture. Field and harvest notes are compiled for each location and results analyzed.

Data Analysis and Reporting

Data from each location is analyzed statistically using SAS. Mean values for yield and additional agronomic data are presented in tables for each location. Mean values are derived from the average of all replications for each entry in each trial. Least Significant Difference (LSD) is a statistical test used that determines the minimum difference between two entries required to be considered having different levels of performance. Differences between entries (yield, plant height, etc.) less than the LSD value represents variation measurements due to factors other than hybrid performance, such as variation in soil type, soil moisture, fertility, insect or disease pressure, planting or harvesting procedures. Although numeric differences in yield or other measurements may exist, if two entries are within the LSD value, they should be considered to have equal performance. The Coefficient of Variation (CV) is used to determine the amount of variability in the data set relative to the mean and can be used to determine if the results are reliable. Generally, CV's greater than 20% indicate that the data is unreliable and is not reported. However, each data set is evaluated individually to determine if results will be reported.

In the 2015 Corn Hybrid Characteristics table you will find agronomic data submitted by each company for their entries. Agronomic information provided by the companies about their hybrids are found in the list below and include items such as cob color, grain color and genetic traits. Agronomic data measured and collected by the Crop Testing program is described in the section below.

Agronomic Data as designated by each company:

Cob Color: R = red, W = white, P = pink.

Grain Color: Y = yellow, W = white.

Measured Agronomic Data:

Days to Silk: the average number of days from planting to the date when 50 percent of the plants within the plot are in some stage of silking (R1).

Plant Height: the average height in inches from ground to top of tassel.

Ear Height: the average height in inches from ground to base of ear.

Grain Moisture: the average moisture at harvest as a percent (%).

Plant Population: the average number of plants per acre at harvest.

Test Weight: is a measure of bulk grain density and is determined by the seed weight per unit of volume. This is measured at harvest and expressed as pounds per bushel.

Yield – Standardized to 15.5% moisture: expressed in bushels per acre (bu/acre) and calculated using $[((100 - \text{moisture} (\%)) / 84.5) * \text{yield (lb/acre)} / 56]$.

In addition to individual site performance, information on multi-year performance for each site is provided. Multi-year tables are presented as 2-year summaries of yield performance data. The entries are ranked according to hybrid performance in the current year.

Rainfall

Available soil moisture during the growing season is often a limiting factor for corn production in Texas. Variation in rainfall patterns can be substantial within a production region and from year to year. A significant gradient in annual rainfall exist in Texas moving east to west. Often, it is useful to look at rainfall amounts for a given region based on the water-year. The water-year corresponds with hydrological cycles and runs from October 1 through September 30. In contrast to annual rainfall amounts, water-year analysis includes periods of time when soil profile moisture recharge can occur. The observed water-year totals are provided in Figure 2.

Figure 2. 2015 water year (October 1, 2014 – September 30, 2015) precipitation in inches

Agronomic information									
Plant Date	3/16/2015								
Harvest Date	7/28/2015								
Irrigated	Yes								
Row Spacing (in)	36								
Number of Rows	2								
Seeds per Acre	28,000								
N (lb/ac)	216								
P2O5 (lb/ac)	72								
K2O (lb/ac)	12								
Precipitation (in)	25.67								
Irrigation (in)	4								
Herbicide									
Applied 2 applications of Roundup									
Trial Notes									
Appreciation expressed to Mr. Wayne Scholtz, retired CEA, for collecting flowering data and monitoring test block. Test block received hail damage on April 24. Leaf shredding was observed along with severe bruising in some plots.									
Common rust ratings were taken on July 1. Ratings are available upon request. Applied 5 oz/A of Oberon for mites on 6/1/15. Applied 4 oz/A of Tilt for rust. Applied Aflaguard at suggested rate for Aflatoxin (A. flavus)									
Soil Type	Knippa clay								
Tillage	Shred stalks, disked twice, ripped, chiseled, bedded								
Previous Crop	Cotton								

*Yields highlighted in yellow are not significantly different (L.S.D., p=0.05) from the top ranked hybrid.

Plant Date	3/30/2015																	
Harvest Date	8/7/2015																	
Irrigated	No																	
Row Spacing (in)	38																	
Number of Rows	2																	
Seeds per Acre	21,000																	
N (lb/ac)	150																	
P2O5 (lb/ac)	45																	
K2O (lb/ac)	23																	
Precipitation (in)	32.31																	
Irrigation (in)																		
Herbicide	Applied a tank mix of 1.5 lb/A Atrazine + .67 pt/A of 2,4-D L6 + 1 qt/A Roundup in January																	
Trial Notes																		
The test block is usually strip-tilled prior to planting, however due to wet field conditions, the test was not strip-tilled. Instead a herbicide was applied prior to planting and test planted in last year's seedbed.																		
Large rain events during the early part of the growing season hampered early plant growth and development. There were some areas in the field where soil remained saturated; thus causing stunting and yellowing of plants.																		
Soil Type	Burleson clay																	
Tillage	None, old beds were used																	
Previous Crop	Grain Sorghum																	

Cooperator Stiles Farm Foundation, Ryan Collett

Four replications of each hybrid are planted in a randomized block design. Model : yield = hybrid blk. LSD provided when hybrid significant at $p < 0.05$. Yields highlighted in yellow are not statistically different from the top ranked hybrid. Plots were planted using Almaco meter units on a JD Max-Emerge II units. Plots were harvested with a JD 3300 plot combine fitted with a Harvest Master GrainGage System. Precipitation data was recorded from January 1 through the harvest date. Herbicide									
1.2 pt/ac of Dual, pre-emerge									
Trial Notes									
Excessive soil moisture delayed planting date approximately 3 weeks. Continued rain events hampered early plant growth and development. Some areas of test block did not drain properly, resulting in standing water.									
This resulted in yellowing of plants and firing of bottom leaves. Yields should be considered good despite the excessive moisture. 1 ton/ac of chicken litter was applied early Fall 2014. Rainfall data obtained from U.S. Corp of Engineers, Lake Bardwell									
Soil Type	Houston black clay								
Tillage	Disc, field cultivate, used rolling harrow								
Previous Crop	Wheat								

Cooperator Bob and Steve Beakley

Four replications of each hybrid are planted in a randomized block design. Model : yield = hybrid blk. LSD provided when hybrid significant at $p < 0.05$. Yields highlighted in yellow are not statistically different from the top ranked hybrid. Plots were planted using Almaco meter units on a JD Max-Emerge II units. Plots were harvested with a JD 3300 plot combine fitted with a Harvest Master GrainGage System. Precipitation data was recorded from January 1 through the harvest date. 2015 Corn

Performance Trial

Brand	Hybrid	GE Trait(s)	Days to 50% Silk	Plant Height (in)	Ear Height (in)	Plants per Acre	Moisture %	Test Weight (lb/bu)	Yield (bu/acre)						
			Mean	59	105	46		18.4	58.2	235					
			C.V. %	2.0	4.2	7.2		8.0	1.1	13.5					
			P>f (hybrid)	0.000	0.000	0.000		0.000	0.000	0.038					
			L.S.D.	1.7	6.2	4.6		2.2	1.0	47.6					
Agronomic information															
Plant Date	5/27/2015														
Harvest Date	10/29/2015														
Irrigated	Yes														
Row Spacing (in)	30														
Number of Rows	2														
Seeds per Acre	32,000														
N (lb/ac)	225														
P2O5 (lb/ac)	10														
K2O (lb/ac)	0														
Precipitation (in)	25.58														
Irrigation (in)	22														
Herbicide															
Applied 1 lb/A of Atrazine + 2 oz/A of Balance Flex prior to planting. Applied 3 oz/A of Status + 22 oz/A of Roundup at V7 stage															
Trial Notes															
*Appreciation expressed to Mr. Mike Bragg, Dallam CEA for securing flowering notes & monitoring test site.															
*Volunteer corn was an issue in the test block. A combination of cultivation and hand-hoeing reduced volunteer plants.															
*12 oz/A of Prevathon applied for grasshopper control. Two additional applications of Prevathon were applied to the outside of field to reduce grasshopper pressure.															
*Used LEPA bubbler at 700 gpm during growing season															
<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 25%;">Soil Type</td><td style="width: 75%;">Dallam loam</td></tr> <tr> <td>Tillage</td><td>Sweep plowed & chiseled before planting. A no-till Kinze planter was used to mark rows for the plot planter</td></tr> <tr> <td>Previous Crop</td><td>Corn</td></tr> </table>										Soil Type	Dallam loam	Tillage	Sweep plowed & chiseled before planting. A no-till Kinze planter was used to mark rows for the plot planter	Previous Crop	Corn
Soil Type	Dallam loam														
Tillage	Sweep plowed & chiseled before planting. A no-till Kinze planter was used to mark rows for the plot planter														
Previous Crop	Corn														

*Yields highlighted in yellow are not significantly different (L.S.D., p=0.05) from the top ranked hybrid.

2-Year Summary

Company	Brand	Hybrid	Yield (bu/acre)
Golden Acres Genetics	Golden Acres	G6611	268
Terral Seed, Inc.	REV	23BHR55	264
Wilbur-Ellis Company	Integra	9678	263
Crop Production Services	Dyna-Gro	D57DC58	258
Terral Seed, Inc.	REV	24BHR93	251
Terral Seed, Inc.	REV	18BHR84	248
Mycogen Seeds	Mycogen	2V709	245
Crop Production Services	Dyna-Gro	D55VP77	245
Terral Seed, Inc.	REV	22BHR43	230

Evaluation of yield across years and/or locations will provide the best indication of consistent hybrid performance. Only hybrids with two years data at each location are displayed.

ACKNOWLEDGMENTS

Appreciation for assistance and cooperation in conducting these tests is expressed to the following:

Farmers: Bob and Steve Beakley (Bardwell test), Justin Crownover (Dumas test), Larry and Clint Kalina (Wharton test), Charles Ring (San Patricio County tests), Paul Aelvoet (Hondo test), Gerald Wilhelm (Dalhart test), and Kenneth Wright (Farmersville test).

Texas A&M AgriLife Research Personnel: Dr. Seth Murray, Alfred Nelson, Jacob Pekar, and Russell Sutton.

Texas A&M AgriLife Extension Personnel: Archie Abrameit, Mark Arnold, Mike Bragg, Ryan Collett, Marcel Fischbacher, Bob McCool.

Other contributers: Personnel at Rio Farms near Monte Alto, TX: Andy Scott, Eddie Hernandez, and Juan Garza. Wayne Scholtz, Retired CEA, Medina County.

Appreciation is also expressed to Monsanto Company for providing the herbicide Roundup that was used to maintain alleyways at the test sites.

Appreciation is also expressed to student workers David Bryant, Anthony Grassia, Hunter Hengst and Mike Valenti for their assistance in conducting the tests.
