Introduction

The statewide Cool-Season Annual Forage Variety Trial data presented in the following pages are the results from six trials coordinated and implemented by numerous Texas A&M AgriLife Extension and Research faculty and staff. We also appreciate the cooperation from Texas County Extension Agents, producers, and private industry partners that contributed locations, property, seed, time and other assets to conduct these field trials. The purpose of this publication is to provide unbiased yield data for forage producers across the state. With this information, Texas forage producers can make educated decisions regarding the most appropriate varieties for their geographic region.

Variety Selection:

Selection of an appropriate cool season forage variety is one of the most important decisions a producer will make. This decision can impact the potential forage yield, forage nutritive value, disease and insect management, and maturity of the crop. It is important that producers have diversity in the varieties planted on their farms to minimize production risks. The choice of varieties depends on the intended use of the crop (forage or dual-purpose) and when forage is most needed. Even though total forage production may be similar, certain species/varieties tend to produce more forage during the fall, winter, or spring. Variety diversification spreads the risk associated with potentially devastating pests (leaf and stripe rust, Hessian fly, wheat curl mite, greenbugs, etc.) and yield loss from adverse environmental factors (freeze, drought, etc.).

Producers should select no fewer than two varieties to plant on their farms and preferably more, depending upon size, location, and purpose of fields. Variety selection should be based upon multiple years of sound data produced from university trials and other reliable sources. High yields over multiple years and multiple locations demonstrate a variety's ability to perform well over diverse environmental factors. Stable yield performance of forage is the best variety selection tool. It is important to consider decreasing yield over a two or three year time frame, which may reflect a change in disease and/or insect resistance.

When selecting a variety for the 2015 season, producers should consider the variables that limited yield in the previous growing season; which may have had a negative impact on the results presented in the following pages. We strongly encourage producers to look at multiple year averages and to look at numerous relevant variety trial locations.

Interpreting the Data:

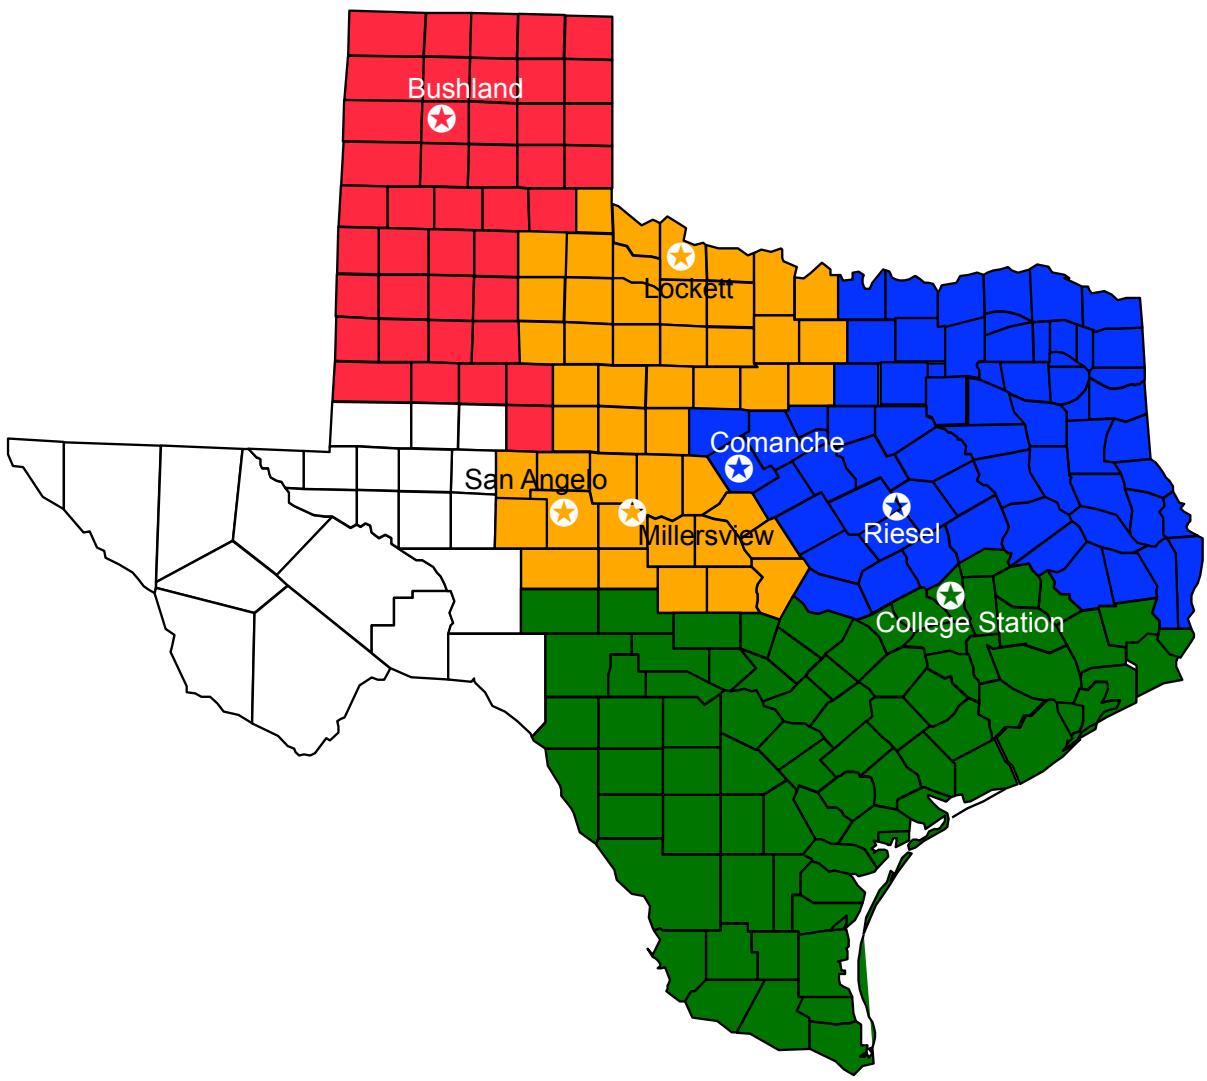

Forage yield at each location has been analyzed using appropriate statistical procedures. The statistical analysis provides the mean, CV, and LSD values. It is important to note these statistical values to prevent misinterpretation of any replicated data.

The mean is another term for the average. Therefore, a mean yield is the average of all the plots within a trial. Individual variety yields can be compared to the mean yield to determine how these varieties performed within the trial (i.e. were they above or below average?). This average can also be used as an indication of the environment for that location. A low mean yield can indicate poor growing conditions during the season; likewise, a high yield average can indicate favorable growing conditions.

The CV (Coefficient of Variation) value, expressed as a percentage, indicates the level of unexplained variability present within the trial. A high CV value indicates considerable variability existed within the trial not related to normal variations that might be expected between the varieties in the test. This variability may be the result from non-uniform stands, non-uniform insect or disease pressure, variability in harvesting, or other issues. Generally, CV values in excess of 25% signify that there were problems in the trial, leading the reader to question the validity of the data as a true representation of varietal performance.

The LSD (Least Significant Difference) value is a numeric range to help the reader determine if the varieties performed differently from one another within the trial. If the LSD value is 2 ton/ac in a trial in which Variety A yielded 6 ton/ac and Variety B yielded 3 ton/ac, then Variety A is said to be significantly better. In that same trial with an LSD value of 2 ton/ac at a 0.05 (5%) significance level, the statistical inference one could say is that Variety A would yield better than Variety B in 19 out of 20 trials conducted in which there was at least a 2 ton/ac difference in yield. In this hypothetical comparison, you might have a 20th trial with a 2 ton/ac difference that there is not truly a difference between Variety A and B, but random chance caused the 2 ton difference.

2014 Texas Region Overview

Texas Blacklands:

The Texas Blacklands had a good growing season for winter pasture compared to much of the rest of the state. Rainfall throughout both September and October allowed for sufficient moisture for early season growth. Cooler weather and sufficient rainfall through December enabled the crop to maintain a good stand and promote fall forage growth. However, colder temperatures throughout the late winter and early spring along with below normal precipitation did not promote much forage growth during this time. An abrupt cold snap in early March burnt back much of the foliage, but plants were able to recover. A second freeze in mid-April forced some producers to harvest wheat for forage instead of grain, due to the level of freeze damage. Insects or diseases were not a substantial concern throughout this area during the 2013-2014 forage season, except for isolated pockets of barley yellow dwarf virus.

Texas High Plains:

Producers in the Texas High Plains struggled this winter with a continuing severe drought. Rainfall events were few and far between, which did little to get a winter crop established. Most fields that were not under irrigation did not survive the winter due both to water availability and cold temperatures. Rainfall throughout this region ranged from 4-6 inches all season long. Temperatures started off normal for planting and were only slightly below normal for the winter and spring. Insects and diseases were not a major problem in winter pastures in this area.

Texas Rolling Plains:

The Texas Rolling Plains producers experienced a decent year for winter pasture production compared to the previous years. Early season rainfall in September and October allowed for good seedling emergence if pastures were planted timely with rainfall; however, the elevated temperatures during this time did not allow the moisture to remain in the upper portion of the soil profile for an extended time. Not unlike many other areas of the state; both rainfall and temperatures were below normal during the late winter and spring seasons. Rainfall increased with temperatures later in April and early May. Like the rest of the state, insects and diseases were not a major problem this year.

South Texas:

In the southern part of the state, winter pasture planting was a challenge to accomplish between rainfall events in September; however, sufficient rainfall throughout the remainder of the fall allowed for good emergence and establishment. Below normal temperatures and rainfall during the winter limited forage growth, but these cooler temperatures and higher rainfall later in the growing season significantly increased spring growth. As with much of the state, insects and diseases were not a significant issue throughout the growing season.

Forage Trial Agronomic Data

Location¹	Cooperator(s)	Yield Limiting Issues	Planting Date	Pesticide Applied (Date)
Bushland²	Texas A&M AgriLife Research and Extension Center	Winterkill on Oats	9/23/13	--
College Station²	Texas A&M Research and Extension Agronomy Farm	Freezes (< 25°F) on 2/14/14 & 3/3/14	9/25/13	Declare (10/11/13) Weedmaster (2/21/14)
Comanche	Indian Creek Farm; Rodney Stephens	Non-uniform grazing; ABANDONED	9/27/13	--
Millersview	Mickey Dillard Joe Beach Millersview Community Producers	Grazing from deer and rabbits	9/26/13	--
Riesel	Lynn Gnismar	Poor emergence volunteer ryegrass; BYDV ³ ABANDONED	9/27/13	Dimethoate 4E Weedmaster (2/21/14)
San Angelo	Texas A&M AgriLife Research and Extension Center	Poor Stand; Drought Conditions following Clip 1	9/26/13	--
Lockett²	Texas A&M AgriLife Research and Extension Center	Winterkill on Oats	9/26/13	--

¹These locations were planted with a seeding rate of 90 lb/a. All seed was treated with Gaucho XT at a rate of 3.4 oz/cwt.

²Bushland, College Station, Comanche and Lockett were irrigated. College Station required an additional 1.5" for stand establishment.
